# WORBLA'S Transpa Art

**Worbla's® Transpa Art (WTA)** – the transparent, thermoplastic sheet material by **Cast4Art!**

Like all the other products of the **Worbla's® Art Series** it is non-toxic and solvent-free. The material should be heated to 120°C (250°F). So it is strongly advised wearing working gloves with rubberized fingers while working with it.

**WTA** cools down after a few minutes but can be reactivated as often as you like. So it can be used to work bit by bit.

It is recommended to use a wet sponge, an old tooth brush, or sculpting tools.

You can also cast **WTA** into moulds. When kneaded the material becomes a little bit milky. Therefore it is possible to create e.g. nicely shining gemstones with LEDs.

Would you like to know more about it?  [blog.Cast4Art.de](http://blog.Cast4Art.de)

You can paint the **Worbla's® Transpa Art** by using e.g. iDyePoly, window colors and spray paint or with a thermal elastic foil which is also used in car tuning.

Surplus material should be, by use of a cutter or something similar, removed after heating the material again. Rough or milky areas can be worked again by using clear lacquer or nail polish.

If one layer is not enough and you need to connect pieces, we recommend to use clear superglue.

Before use it's strongly advised to watch the **HowToUse** intro at the **Cast4Art You Tube Channel**:

Check our **Cast4Art** blog for this & more videos and pictures or our social media channels for much more info about!
